

- Deployment will create a replica set with specific image version
 - When a new version of image is deployed and a new version of replica set is created with in deployment.

- kubectl create deployment nginxdeployment --image=nginx
- kubectl get deployments
- Update: kubectl apply -f nginxdeployment.yaml

 - kubectl set image deployment/nginxdeployment <containerName>=nginx:1.9.1
- kubectl rollout status deployment/myapp-deployment

- We can setup deployment strategy in deployment yaml file
 Rolling updates strategy will deploy the pods one by one.
